

DECOMPOSER

Sitala from Decomposer, 16-pad drum sampler, updates to 2.1

July 9, 2026 | info@decomposer.de | decomposer.de

Decomposer has released Sitala 2.1, an update to their drum sampler, currently listed on KVR as the 5th most popular drum sampler on the market.

It's got 16 pads, automatic beat slicing, and a surprising amount of depth in its 6 controls for tweaking sounds.

Our users have asked, and we've listened. Sitala is really popular with Reaper users because it's deep integration with that DAW, and who doesn't hate opening up an old project just to find their samples have been reorganized, deleted, moved to another drive, or similar. This new version of Sitala collects all of the samples used in a Reaper projects, and saves them along with a special Sitala kit for each track containing all of the samples used in the project.

Another "your users will tell you what they care about"-win is tuning drum pitches to actual pitches. For pitched samples like toms or kicks, Sitala now snaps to note frequencies when fiddling with the tuning knob.

Using Sitala live? Lots of people are. And now you can switch your Sitala kit based on a MIDI program change or control change signal.

Have your studio machine siloed away from Instagram and the whiles of the interwebs? Sitala's got you there now too with offline activation.

The update's free for Sitala 2 users, and just \$20 for everyone else. Grab it at decomposer.de.
